

## TPSB2 抗原(重组蛋白)

中文名称: TPSB2 抗原(重组蛋白)

英文名称: TPSB2 Antigen (Recombinant Protein)

别 名: TPS2; tryptaseB; tryptaseC

储 存: 冷冻(-20℃)

相关类别: 抗原

概述

## Full length fusion protein

## 技术规格

Full name:	tryptase beta 2 (gene/pseudogene)
Synonyms:	TPS2; tryptaseB; tryptaseC
Swissprot:	P20231
Gene Accession:	BC029356
Purity:	>85%, as determined by Coomassie blue stained SDS-PAGE
Expression system:	Escherichia coli
Tags:	His tag C-Terminus, GST tag N-Terminus
Background:	Tryptases comprise a family of trypsin-like serine proteases, the pepti dase family S1. Tryptases are enzymatically active only as heparin-sta bilized tetramers, and they are resistant to all known endogenous pro teinase inhibitors. Several tryptase genes are clustered on chromosom e 16p13.3. These genes are characterized by several distinct features. They have a highly conserved 3' UTR and contain tandem repeat seq uences at the 5' flank and 3' UTR which are thought to play a role in regulation of the mRNA stability. These genes have an intron imme diately upstream of the initiator Met codon, which separates the site of transcription initiation from protein coding sequence. This feature is

s characteristic of tryptases but is unusual in other genes. The alleles of this gene exhibit an unusual amount of sequence variation, such t hat the alleles were once thought to represent two separate genes, b eta II and beta III. Beta tryptases appear to be the main isoenzymes expressed in mast cells, whereas in basophils, alpha-tryptases predomi nate. Tryptases have been implicated as mediators in the pathogenesis of asthma and other allergic and inflammatory disorders.
